Cloud Infrastructure Resilience and Disaster Recovery Playbook

1.0 Recovery Time Objective (RTO) and RPO Targets

Critical services have an RTO of 1 hour and RPO of 15 minutes. High-availability architecture is documented in the AWS Well-Architected Reliability Pillar. Failover drills are coordinated on the Incident Dashboard.

Reference: Incident Dashboard

Reference: Legacy Disaster Recovery Runbook

2.0 Database Backup Replication and Snapshotting

PostgreSQL snapshots are replicated across secondary availability zones. Monitor replication lag using Prometheus Metrics Portal. Restore scripts are maintained in the Ops Repository.

3.0 DNS Failover and Traffic Shifting

Route53 health checks trigger automated global DNS switching. Read the Cloudflare DDoS Mitigation protocols and test health probe endpoints through the Status API.
